

Claims

1. A portable bow press capable of being used to assemble and disassemble high powered compound bows having either two piece limbs or one piece limbs, comprising;

a first and a second extending member made of ridged material;

each said extending member having means of engagement with the outer portion of one said limb of said compound bow;

each said extending member having the means to cooperate with outer portion of one said limb of said compound bow;

each said extending member having means to extend a distance beyond outer end of each said limb;

first end of an adjusting device being adjustably connected to a central point on the outer edge of said first extending member;

second end of said adjusting device being adjustably connected to a central point on the outer edge of said second extending member;

where by shortening said adjusting device will force the said extending member inward against the outer ends of said limbs of said compound bow causing said limbs to flex inward over their entire length.
